(57) Abstract :

The present invention relates to a method of adapting a composite signature of a phenotype. The method comprises the steps of providing for a composite signature of a phenotype with at least two different data types which were respectively generated by two different modalities of measuring a specimen. Due to an adaption of one part of the signature of the phenotype the resulting adapted phenotype signature can be used as an input for a signature evaluation tool that was derived from data measured by a third modality of measurement.
